

# Tech Bulletin: Running Liquid Fertilizer with Pro 600/700 with 20/20 controlling seeding on CNH.

April 22, 2013

**Problem:** When converting a CNH planter with a Pro 600 or Pro 700 over to the 20/20 for planter monitoring and seeding control through RowFlow, problems can arise in the Pro 600/700 in running the liquid fertilizer hydraulic motor without seeing seed or controlling the seeding motors.

**Solution:** According to CNH product support, this can be accomplished by having a CNH dealer technician reprogram the ECU on the planter using their electronic service tool to be a ground drive planter. Row alarms will also need to be disabled on the Row tab of the Work Condition page on the Pro 600/700 (see below).
